

ABSTRACT OF THE DISCLOSURE

A control assembly for controlling reciprocal motion of a stopper used with a tundish dish including a shaft movably guided within a guiding assembly and connected to the stopper and wherein a motor is movable between a first position wherein output from the motor is disengaged from a motion converting device connected to the shaft and a second position wherein the motor is drivingly engaged with the motion converting device. A linking device is also provided to secure the motor relative to the motion converting device in the second position thereof.

In the Abstract of the Disclosure

Submitted herewith on a separate sheet is a new Abstract of the Disclosure that should be entered in place of the originally submitted Abstract. It would be appreciated if the Examiner would indicate the acceptance of the new Abstract in the next Office Communication. No new matter is being submitted.
